Answers Part 1 Cell Theory 1 The three main points of the cell theory are All living organisms are composed of one or more cells The cell is the basic unit of structure and function in all living organisms All cells arise from preexisting

cells 2 The cell theory is significant because it provides a fundamental framework for understanding the organization of life and the origin of all living organisms 3 The cell theory has been modified over time with the discovery of new cellular structures and processes such as the presence of organelles in eukaryotic cells and the role of DNA as the genetic material

Part 2 Types of Cells

1 Key differences between prokaryotic and eukaryotic cells Prokaryotic cells lack a nucleus and other membranebound organelles Eukaryotic cells have a nucleus and other membranebound organelles Prokaryotic cells are typically smaller than eukaryotic cells Prokaryotic cells have a simpler structure and organization

2 Examples Prokaryotes Bacteria and Archaea Eukaryotes Plants animals fungi and protists

3 Eukaryotic cells are considered more complex because they have a more sophisticated internal organization with specialized compartments organelles that perform specific functions

Part 3 Organelles

4 Table 1 Organelle Structure and Function

Organelle	Structure	Function
Nucleus	A large spherical organelle enclosed by a double membrane nuclear envelope containing DNA and RNA	Stores genetic information DNA and controls cellular activities through the synthesis of proteins
Mitochondria	Elongated beanshaped organelles with an outer membrane and an inner membrane folded into cristae	Powerhouse of the cell produces ATP adenosine triphosphate through cellular respiration
Endoplasmic Reticulum	A network of interconnected membranes that extend throughout the cytoplasm	Smooth ER synthesizes lipids and steroids while rough ER modifies and transports proteins
Golgi Apparatus	A stack of flattened membranebound sacs cisternae	Involved in protein modification sorting and packaging Packages and modifies proteins for secretion or delivery to other organelles
Lysosome	Small spherical organelles containing digestive enzymes	Breaks down cellular waste debris and engulfed pathogens
Ribosome	Small granular structures composed of RNA and protein	Synthesize proteins based on the instructions encoded in mRNA
Cell Membrane	A thin flexible barrier that surrounds the cell composed of phospholipids and proteins	Regulates the passage of substances into and out of the cell
Cell Wall Plant Cells	A rigid outer layer surrounding the cell membrane composed primarily of cellulose	Provides structural support and protection to the cell

Part 4 Cellular Processes

1 Protein synthesis is the process of creating proteins based on the instructions encoded in DNA This involves DNA transcription The genetic code in DNA is transcribed into a molecule of messenger RNA mRNA mRNA translation Ribosomes read the code in mRNA and assemble amino acids into a polypeptide chain which folds into a protein

2 Mitochondria generate energy in the form of ATP through cellular respiration which involves Glycolysis The breakdown of glucose into pyruvate in the cytoplasm Krebs Cycle The oxidation of pyruvate in the mitochondrial matrix producing electron carriers NADH and FADH₂

5 Electron Transport Chain The transfer of electrons through a series of protein complexes in the inner mitochondrial membrane resulting in ATP production

3 The endoplasmic reticulum ER plays a crucial role in protein modification and lipid synthesis Rough ER Ribosomes attached to the rough ER synthesize proteins which are then modified and transported through the ER Smooth ER Synthesizes lipids steroids and phospholipids and detoxifies harmful substances

4 The Golgi apparatus processes and packages proteins for secretion or delivery to other organelles Modification Proteins are further modified and processed within the Golgi cisternae Sorting Proteins are sorted based on their destination Packaging Proteins are packaged into transport vesicles for delivery to their final destinations

Part 5 Comparison of Plant and Animal Cells

1 Key differences between plant cells and animal cells Cell Wall Plant cells have a cell wall while animal cells do not Chloroplasts Plant cells contain chloroplasts which are responsible for photosynthesis while animal cells do not Vacuoles Plant cells have a large central vacuole while animal cells may have smaller vacuoles

2 Specific organelles present in plant cells but not animal cells Chloroplasts Cell Wall Central Vacuole

3 The differences in organelles reflect the different functions of plant and animal cells Cell Wall Provides structural support and protection in plant cells which are typically immobile Chloroplasts Enable plants to carry out photosynthesis producing their own food Central Vacuole Stores water nutrients and
